SUMMARY

Software engineer who takes products from a business problem to a live, dependable platform. **I own the full stack of a product, from system design, APIs and data models to web and mobile frontends, deployment and operations**, and integrate AI where it adds real value. At Datawise Africa I engineer the company's core products, including Sheria AI, a legal research platform serving advocates and law students, and Pursuit, an opportunity discovery platform, alongside client systems for the health, research and education sectors. Equally effective owning a product alone or as part of a team, with a record of on-time delivery and measurable results.

EXPERIENCE

Software & AI Engineer, Datawise Africa

Feb 2026 – Present • Nairobi / Remote

Kenyan software and AI company building its own products and delivering systems for clients.

Sheria AI: legal research platform for Kenyan law

- **Built and deployed the platform end to end:** backend services, a searchable corpus of the Constitution, statutes and case law, and the web client. Successfully launched with an active user base of advocates and law students on a stable platform.
- **Engineered the core services:** an AI research pipeline that answers with cited provisions, multi-provider failover so a request survives an outage, and an evaluation workflow so every change ships on evidence.

Pursuit: opportunity discovery and proposal platform

- **Designed the backend and workflow engine** for a platform that finds grants, tenders, fellowships, partnerships and jobs matched to an organisation's or individual's profile and drafts tailored applications. Long-running, resumable runs on Temporal workflows, an agent layer for search, verification and drafting, human-in-the-loop approval and full run traceability.

In-house and client projects

- **Part of the engineering team delivering client systems** across the health, research and education sectors: reliable, AI-ready platforms that run hospital operations, research workflows and school administration.
- **Deployment and operations:** containerised services with Docker, infrastructure automated with Ansible, Nginx, GitHub Actions CI/CD, Prometheus monitoring, automated backups with a documented restore procedure, and security hardening covering TLS, firewalling, role-based access and rate limiting.

Software Engineer, Digital Apex

Dec 2024 – Jan 2026 • Remote

Kenyan technology company building its own products and delivering projects for clients.

- **Owned the company's commerce platform end to end:** orders, quotes and payments, role-based access, background job processing, automated releases, monitoring and backups, plus an AI assistant for customers. Set the team's code review, documentation and release standards so any project could be handed over cleanly.
- **Delivered client systems end to end**, from the first requirements conversation to live service and handover: web platforms, operational dashboards and AI assistants for healthcare and education organisations.

Software Engineer, Bee MultiScent Ltd

Feb 2023 – Dec 2024 • Hybrid

Scent-technology startup incubated at the Chandaria Business Innovation and Incubation Centre, Kenyatta University. Joined as an intern and was retained on staff as a software engineer.

- **Built the operations portal the business runs on**, with live dashboards, real-time alerts and a mobile companion app. Earned an official recommendation letter for performance and teamwork.
- **Built the software and AI behind the company's smart diffuser and scent service:** deciding which scent its connected devices release, when and how much, recommending which scents blend well together, and giving clients personalised scent advice.

SELECTED PROJECTS

- **School management system.** A platform for administrators, teachers, students and parents covering admissions, fees and results.
- **Online learning system.** Courses, exams, CATs, grading and certification in one platform.
- **Tour-booking marketplace.** Bookings with mobile-money and card payments and automated referral commissions.
- **Ummly, Islamic research platform.** An AI-enabled research platform that grounds and cites every answer from its in-platform library. Shipped the web and mobile apps.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL

Backend: Django, FastAPI, REST API design, Celery, Redis, background jobs and scheduling, authentication and role-based access, payment integrations (mobile money and card)

Frontend & Mobile: React, React Native, TypeScript, responsive web applications

Data: PostgreSQL, data modelling, pgvector, Pinecone

DevOps & Infra: Docker, Linux VPS, Ansible, Nginx, GitHub Actions CI/CD, Prometheus, backup and disaster recovery, security hardening

AI Integration: LLM APIs (OpenAI, Gemini, Groq), RAG, LangGraph agents, Temporal workflows, evaluation

Practices: System design, automated testing and CI, code review, technical documentation

SOFT SKILLS

Product & Problem Solving: Understands client and business needs, identifies the real problem, and designs software that solves it and automates the process behind it.

End-to-End Ownership: Builds products from the ground up, alone or within a team: core backend, frontend and the AI layer, through to deployment and support.

Delivery & Self-Management: Self-directed and proven in remote work, delivering on time with measurable outcomes.

Collaboration: Works closely with clients and stakeholders, and fits quickly into existing engineering teams.

EDUCATION

Bachelor of Business Information Technology, Mount Kenya University (Major: Software Development and Artificial Intelligence)

CERTIFICATIONS

- **Backend Engineer Certification**
- **AI Engineer Certification**
