SUMMARY

AI and software engineer who takes products from a business problem to a live, dependable platform. **I own the full stack of a product, from backend and frontend to the AI layer, deployment and operations**, with a focus on agentic and retrieval-based AI that is grounded, verifiable and reliable. At Datawise Africa I engineer the company's AI products, including Sheria AI, a legal research platform serving advocates and law students, and Pursuit, a multi-agent opportunity discovery platform. Equally effective owning a product alone or as part of a team, with a record of on-time delivery and measurable results.

EXPERIENCE

AI & Software Engineer, Datawise Africa

Feb 2026 – Present • Nairobi / Remote

Kenyan software and AI company building its own AI products and delivering systems for clients.

Pursuit: AI opportunity discovery and proposal platform

- **Built a multi-agent platform** that hunts down opportunities matched to an organisation's or individual's profile, from grants, tenders and fellowships to partnerships and jobs, verifies and scores each one, and drafts a tailored proposal or application for human review. LangGraph supervisor, researcher, verifier and judge agents on Temporal workflows, with human-in-the-loop approval and full run traceability.

Sheria AI: legal research platform for Kenyan law

- **Built and deployed an agentic RAG platform** that answers legal questions with cited provisions from the Constitution, statutes and case law. Successfully launched with an active user base of advocates and law students on a stable platform.
- **Engineered the AI core:** agentic retrieval over vector search with reranking, multi-model routing and failover, and evaluation through LLM-as-a-judge and blind A/B testing so every change ships on evidence.

In-house and client projects

- **Part of the engineering team delivering client systems** across the health, research and education sectors: reliable, AI-ready platforms that run hospital operations, research workflows and school administration.
- **Deployment and operations:** containerised services with Docker, Ansible, Nginx and CI/CD, backed by monitoring, automated backups and security hardening.

Software Engineer, Digital Apex

Dec 2024 – Jan 2026 • Remote

Kenyan technology company building its own products and delivering projects for clients.

- **Delivered AI systems for clients end to end**, from the first requirements conversation to live service and handover: support chatbots, document-grounded assistants and operational dashboards for healthcare and education organisations.
- **Owned the company's commerce platform and its AI assistant**, covering orders, quotes and payments, with role-based access, background processing, automated releases, monitoring and backups. Set the team's review, documentation and release standards so any project could be handed over cleanly.

Software Engineer, Bee MultiScent Ltd

Feb 2023 – Dec 2024 • Hybrid

Scent-technology startup incubated at the Chandaria Business Innovation and Incubation Centre, Kenyatta University. Joined as an intern and was retained on staff as a software engineer.

- **Built the AI behind the company's smart diffuser and scent service:** deciding which scent its connected devices release, when and how much, recommending which scents blend well together, and giving clients personalised scent advice.
- **Built the operations portal the business runs on**, with live dashboards, real-time alerts and a mobile companion app. Earned an official recommendation letter for performance and teamwork.

SELECTED PROJECTS

- **Ummly, Islamic research platform.** An AI-enabled research platform that grounds and cites every answer from its in-platform library. Shipped the web and mobile apps.
- **Client platforms.** A tour-booking marketplace with mobile-money and card payments; a school management system for admissions, fees and results; and an online learning system covering courses, exams, CATs, grading and certification.

TECHNICAL SKILLS

Agentic Systems: LangGraph multi-agent orchestration (supervisor, tool-calling workers, verifier and judge agents), Temporal durable workflows, human-in-the-loop approval, structured outputs, run budgets and graceful degradation

LLMs: OpenAI, open-weight models via Groq (gpt-oss, LLaMA), Google Gemini, DeepSeek; model tiering, routing and fallback; versioned prompts as configuration

Retrieval: RAG design, Pinecone, pgvector, ChromaDB, embeddings, chunking strategy, reranking, hybrid search, confidence thresholds and refusal

Evaluation & Safety: LLM-as-a-judge, blind A/B comparison, scorecards and eval datasets, hallucination control, source grounding, prompt-injection defence, deterministic tests with stubbed models in CI

Engineering: Python, Django, FastAPI, Celery, Redis, PostgreSQL, TypeScript, React, React Native

Production & Infra: Docker, Linux VPS, Ansible, Prometheus, Nginx, GitHub Actions CI/CD, backup and disaster recovery, security hardening

SOFT SKILLS

Product & Problem Solving: Understands client and business needs, identifies the real problem, and designs software that solves it and automates the process behind it.

End-to-End Ownership: Builds products from the ground up, alone or within a team: core backend, frontend and the AI layer, through to deployment and support.

Delivery & Self-Management: Self-directed and proven in remote work, delivering on time with measurable outcomes.

Collaboration: Works closely with clients and stakeholders, and fits quickly into existing engineering teams.

EDUCATION

Bachelor of Business Information Technology, Mount Kenya University (Major: Software Development and Artificial Intelligence)

CERTIFICATIONS

- **AI Engineer Certification**
- **Backend Engineer Certification**
